

# Package ‘DelayedMatrixStats’

May 18, 2026

**Type** Package

**Title** Functions that Apply to Rows and Columns of 'DelayedMatrix' Objects

**Version** 1.35.0

**Date** 2025-01-09

**Description** A port of the 'matrixStats' API for use with DelayedMatrix objects from the 'DelayedArray' package. High-performing functions operating on rows and columns of DelayedMatrix objects, e.g. col / rowMedians(), col / rowRanks(), and col / rowSds(). Functions optimized per data type and for subsetted calculations such that both memory usage and processing time is minimized.

**License** MIT + file LICENSE

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Depends** MatrixGenerics (>= 1.15.1), DelayedArray (>= 0.31.7)

**Imports** methods, sparseMatrixStats (>= 1.13.2), Matrix (>= 1.5-0), S4Vectors (>= 0.17.5), IRanges (>= 2.25.10), SparseArray (>= 1.5.19)

**Suggests** testthat, knitr, rmarkdown, BiocStyle, microbenchmark, profmem, HDF5Array, matrixStats (>= 1.0.0)

**VignetteBuilder** knitr

colAlls,DelayedMatrix-method

*Check if all elements in a row (column) of a matrix-like object are equal to a value*

---

### Description

Check if all elements in a row (column) of a matrix-like object are equal to a value.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colAlls(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
colAnys(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowAlls(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowAnys(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

**Arguments**

x                    A NxK [DelayedMatrix](#).

rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
value	The value to search for.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

### Details

The S4 methods for `x` of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowAlls / matrixStats::colAlls`.

### Value

Returns a [logical vector](#) of length `N (K)`.

### Author(s)

Peter Hickey

### See Also

- `matrixStats::rowAlls()` and `matrixStats::colAlls()` which are used when the input is a [matrix](#) or [numeric vector](#).
- For checks if *any* element is equal to a value, see [rowAnys\(\)](#).
- `base::all()`.

### Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

colAlls(dm_matrix, value = 1)
colAnys(dm_matrix, value = 2)
rowAlls(dm_rle, value = 1)
rowAnys(dm_rle, value = 2)
```

---

 colAnyNAs,DelayedMatrix-method

*Check if any elements in a row (column) of a matrix-like object is missing*

---

## Description

Check if any elements in a row (column) of a matrix-like object is missing.

## Usage

```
## S4 method for signature 'DelayedMatrix'
colAnyNAs(
  x,
  rows = NULL,
  cols = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowAnyNAs(
  x,
  rows = NULL,
  cols = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

## Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

## Details

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowAnyNAs / matrixStats::colAnyNAs`.

**Value**

Returns a [logical vector](#) of length N (K).

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowAnyNAs()` and `matrixStats::colAnyNAs()` which are used when the input is a matrix or numeric vector.
- For checks if any element is equal to a value, see `rowAnys()`.
- `base::is.na()` and `base::any()`.

**Examples**

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

dm_matrix[dm_matrix > 3] <- NA
colAnyNAs(dm_matrix)
dm_HDF5[dm_HDF5 > 3] <- NA
rowAnyNAs(dm_HDF5)
```

---

colAvgPerRowSet,DelayedMatrix-method

*Calculates for each row (column) a summary statistic for equally sized subsets of columns (rows)*

---

**Description**

Calculates for each row (column) a summary statistic for equally sized subsets of columns (rows).

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colAvgPerRowSet(
  X,
  W = NULL,
  cols = NULL,
  S,
  FUN = colMeans,
```

```

    ...,
    force_block_processing = FALSE,
    na.rm = NA,
    tFUN = FALSE
  )

## S4 method for signature 'DelayedMatrix'
rowAvgPerColSet(
  X,
  W = NULL,
  rows = NULL,
  S,
  FUN = rowMeans,
  ...,
  force_block_processing = FALSE,
  na.rm = NA,
  tFUN = FALSE
)

```

### Arguments

X	A NxM <a href="#">DelayedMatrix</a> .
W	An optional numeric NxM matrix of weights.
S	An <a href="#">integer</a> KxJ matrix that specifying the J subsets. Each column hold K column (row) indices for the corresponding subset. The range of values is [1, M] ([1,N]).
FUN	A row-by-row (column-by-column) summary statistic function. It is applied to each column (row) subset of X that is specified by S.
...	Additional arguments passed to specific methods.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <code>base::array</code> .
na.rm	(logical) Argument passed to FUN() as <code>na.rm = na.rm</code> . If NA (default), then <code>na.rm = TRUE</code> is used if X or S holds missing values, otherwise <code>na.rm = FALSE</code> .
tFUN	If TRUE, X is transposed before it is passed to FUN.
rows, cols	A <a href="#">vector</a> indicating the subset (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.

### Details

The S4 methods for x of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowAvgPerColSet` / `matrixStats::colAvgPerRowSet`.

### Value

Returns a numeric JxN (MxJ) matrix.

### Author(s)

Peter Hickey

**See Also**

- `matrixStats::rowAvsPerColSet()` and `matrixStats::colAvsPerRowSet()` which are used when the input is a matrix or numeric vector.

**Examples**

```
# A DelayedMatrix with a 'DataFrame' seed
dm_DF <- DelayedArray(S4Vectors::DataFrame(C1 = rep(1L, 5),
                                           C2 = as.integer((0:4) ^ 2),
                                           C3 = seq(-5L, -1L, 1L)))

colAvsPerRowSet(dm_DF, S = matrix(1:2, ncol = 2))

rowAvsPerColSet(dm_DF, S = matrix(1:2, ncol = 1))
```

---

colCollapse,DelayedMatrix-method

*Extract one cell from each row (column) of a matrix-like object*

---

**Description**

Extract one cell from each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colCollapse(
  x,
  idxs,
  cols = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowCollapse(
  x,
  idxs,
  rows = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

**Arguments**

`x` A  $N \times K$  [DelayedMatrix](#).

`idxs` An index [vector](#) with the position to extract. It is recycled to match the number of rows (column)

force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <code>base::array</code> .
...	Additional arguments passed to specific methods.
useNames	If <b>TRUE</b> (default), names attributes of result are set. Else if <b>FALSE</b> , no naming support is done.
rows, cols	A <b>vector</b> indicating the subset of rows (and/or columns) to operate over. If <b>NULL</b> , no subsetting is done.

### Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowCollapse` / `matrixStats::colCollapse`.

### Value

Returns a **numeric vector** of length `N (K)`.

### Author(s)

Peter Hickey

### See Also

- `matrixStats::rowCollapse()` and `matrixStats::colCollapse()` which are used when the input is a `matrix` or `numeric` vector.

### Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# Extract the 4th row as a vector
# NOTE: An ordinary vector is returned regardless of the backend of
#       the DelayedMatrix object
colCollapse(dm_matrix, 4)
colCollapse(dm_HDF5, 4)

# Extract the 2nd column as a vector
# NOTE: An ordinary vector is returned regardless of the backend of
#       the DelayedMatrix object
rowCollapse(dm_matrix, 2)
```

```
rowCollapse(dm_HDF5, 2)
```

---

```
colCounts,DelayedMatrix-method
```

*Count how often an element in a row (column) of a matrix-like object is equal to a value*

---

## Description

Count how often an element in a row (column) of a matrix-like object is equal to a value.

## Usage

```
## S4 method for signature 'DelayedMatrix'
colCounts(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowCounts(
  x,
  rows = NULL,
  cols = NULL,
  value = TRUE,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

## Arguments

<code>x</code>	A $N \times K$ <a href="#">DelayedMatrix</a> .
<code>rows, cols</code>	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
<code>value</code>	The value to search for.
<code>na.rm</code>	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
<code>force_block_processing</code>	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .

... Additional arguments passed to specific methods.

useNames If **TRUE** (default), names attributes of result are set. Else if **FALSE**, no naming support is done.

### Details

The S4 methods for x of type **matrix**, **array**, **table**, or **numeric** call `matrixStats::rowCounts / matrixStats::colCounts`.

### Value

Returns a **integer vector** of length N (K).

### Author(s)

Peter Hickey

### See Also

- `matrixStats::rowCounts()` and `matrixStats::colCounts()` which are used when the input is a **matrix** or **numeric vector**.
- For checks if any element is equal to a value, see `rowAnys()`. To check if all elements are equal, see `rowAlls()`.

### Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'DataFrame' seed
dm_DF <- DelayedArray(S4Vectors::DataFrame(C1 = rep(1L, 5),
                                           C2 = as.integer((0:4) ^ 2),
                                           C3 = seq(-5L, -1L, 1L)))

colCounts(dm_matrix, value = 1)
# Only count those in the first 4 rows
colCounts(dm_matrix, rows = 1:4, value = 1)

rowCounts(dm_DF, value = 5)
# Only count those in the odd-numbered rows of the 2nd column
rowCounts(dm_DF, rows = seq(1, nrow(dm_DF), 2), cols = 2, value = 5)
```

---

colCummaxs,DelayedMatrix-method

*Calculates the cumulative maxima for each row (column) of a matrix-like object*

---

### Description

Calculates the cumulative maxima for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'  
colCummaxs(  
  x,  
  rows = NULL,  
  cols = NULL,  
  force_block_processing = FALSE,  
  ...,  
  useNames = TRUE  
)
```

```
## S4 method for signature 'DelayedMatrix'  
colCummins(  
  x,  
  rows = NULL,  
  cols = NULL,  
  force_block_processing = FALSE,  
  ...,  
  useNames = TRUE  
)
```

```
## S4 method for signature 'DelayedMatrix'  
colCumprods(  
  x,  
  rows = NULL,  
  cols = NULL,  
  force_block_processing = FALSE,  
  ...,  
  useNames = TRUE  
)
```

```
## S4 method for signature 'DelayedMatrix'  
colCumsums(  
  x,  
  rows = NULL,  
  cols = NULL,  
  force_block_processing = FALSE,  
  ...,  
  useNames = TRUE  
)
```

```
## S4 method for signature 'DelayedMatrix'  
rowCummaxs(  
  x,  
  rows = NULL,  
  cols = NULL,  
  force_block_processing = FALSE,  
  ...,  
  useNames = TRUE  
)
```

```
## S4 method for signature 'DelayedMatrix'
```

```

rowCummins(
  x,
  rows = NULL,
  cols = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowCumprods(
  x,
  rows = NULL,
  cols = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowCumsums(
  x,
  rows = NULL,
  cols = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

```

### Arguments

<code>x</code>	A $N \times K$ <a href="#">DelayedMatrix</a> .
<code>rows, cols</code>	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
<code>force_block_processing</code>	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
<code>...</code>	Additional arguments passed to specific methods.
<code>useNames</code>	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

### Details

The S4 methods for `x` of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowCummaxs` / `matrixStats::colCummaxs`.

### Value

Returns a [numeric matrix](#) with the same dimensions as `x`.

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowCummaxs()` and `matrixStats::colCummaxs()` which are used when the input is a matrix or numeric vector.
- For single maximum estimates, see `rowMaxs()`.
- `base::cummax()`.

**Examples**

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colCummaxs(dm_matrix)

colCummins(dm_matrix)

colCumprods(dm_matrix)

colCumsums(dm_matrix)

# Only use rows 2-4
rowCummaxs(dm_Matrix, rows = 2:4)

# Only use rows 2-4
rowCummins(dm_Matrix, rows = 2:4)

# Only use rows 2-4
rowCumprods(dm_Matrix, rows = 2:4)

# Only use rows 2-4
rowCumsums(dm_Matrix, rows = 2:4)
```

---

colDiffs,DelayedMatrix-method

*Calculates the difference between each element of a row (column) of a matrix-like object*

---

**Description**

Calculates the difference between each element of a row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colDiffs(
  x,
  rows = NULL,
  cols = NULL,
  lag = 1L,
  differences = 1L,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowDiffs(
  x,
  rows = NULL,
  cols = NULL,
  lag = 1L,
  differences = 1L,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

**Arguments**

x	A $N \times K$ <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
lag	An integer specifying the lag.
differences	An integer specifying the order of difference.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

**Details**

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowDiffs / matrixStats::colDiffs`.

**Value**

Returns a [numeric matrix](#) with one column (row) less than x:  $Nx(K - 1)$  or  $(N - 1)xK$ .

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowDiffs()` and `matrixStats::colDiffs()` which are used when the input is a matrix or numeric vector.
- `base::diff()`.

**Examples**

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

colDiffs(dm_matrix)

rowDiffs(dm_HDF5)
# In reverse column order
rowDiffs(dm_HDF5, cols = seq(ncol(dm_HDF5), 1, -1))
```

---

colIQRDiffs,DelayedMatrix-method

*Calculates the interquartile range of the difference between each element of a row (column) of a matrix-like object*

---

**Description**

Calculates the interquartile range of the difference between each element of a row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colIQRDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
```

```
    useNames = TRUE
  )

## S4 method for signature 'DelayedMatrix'
colMadDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
colSdDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
colVarDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowIQRDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
```

```

    useNames = TRUE
  )

## S4 method for signature 'DelayedMatrix'
rowMadDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowSdDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowVarDiffs(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  diff = 1L,
  trim = 0,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

```

### Arguments

<code>x</code>	A $N \times K$ <a href="#">DelayedMatrix</a> .
<code>rows, cols</code>	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
<code>na.rm</code>	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
<code>diff</code>	An integer specifying the order of difference.
<code>trim</code>	A double in $[0, 1/2]$ specifying the fraction of observations to be trimmed from each end of (sorted) <code>x</code> before estimation.

force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <code>base::array</code> .
...	Additional arguments passed to specific methods.
useNames	If <b>TRUE</b> (default), names attributes of result are set. Else if <b>FALSE</b> , no naming support is done.

## Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowIQRDiffs` / `matrixStats::colIQRDiffs`.

## Value

Returns a `numeric vector` of length `N (K)`.

## Author(s)

Peter Hickey

## See Also

- `stats::IQR()`.

### Examples

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colIQRs(dm_matrix)

# Only using rows 2-4
rowIQRs(dm_matrix, rows = 2:4)
```

---

colLogSumExps,DelayedMatrix-method

*Accurately calculates the logarithm of the sum of exponentials for each row (column) of a matrix-like object*

---

### Description

Accurately calculates the logarithm of the sum of exponentials for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colLogSumExps(
  lx,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowLogSumExps(
  lx,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

**Arguments**

<code>lx</code>	A $N \times K$ <b>DelayedMatrix</b> . Typically, <code>lx</code> are $\log(x)$ values.
<code>rows, cols</code>	A <b>vector</b> indicating the subset (and/or columns) to operate over. If <code>NULL</code> , no subsetting is done.
<code>na.rm</code>	If <code>TRUE</code> , missing values ( <code>NA</code> or <code>NaN</code> ) are omitted from the calculations.
<code>force_block_processing</code>	<code>FALSE</code> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <code>TRUE</code> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <code>base::array</code> .
<code>...</code>	Additional arguments passed to specific methods.
<code>useNames</code>	If <code>TRUE</code> (default), names attributes of result are set. Else if <code>FALSE</code> , no naming support is done.

**Details**

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowLogSumExps` / `matrixStats::colLogSumExps`.

**Value**

Returns a **numeric vector** of length  $N$  ( $K$ ).

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowLogSumExps()` and `matrixStats::colLogSumExps()` which are used when the input is a matrix or numeric vector.
- `rowSums2()`

**Examples**

```
x <- DelayedArray(matrix(runif(10), ncol = 2))
colLogSumExps(log(x))
rowLogSumExps(log(x))
```

---

colMads,DelayedMatrix-method

*Calculates the median absolute deviation for each row (column) of a matrix-like object*

---

**Description**

Calculates the median absolute deviation for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colMads(
  x,
  rows = NULL,
  cols = NULL,
  center = NULL,
  constant = 1.4826,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
colSds(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowMads(
  x,
```

```

    rows = NULL,
    cols = NULL,
    center = NULL,
    constant = 1.4826,
    na.rm = FALSE,
    force_block_processing = FALSE,
    ...,
    useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowSds(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

```

### Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
center	(optional) the center, defaults to the row means
constant	A scale factor. See <code>stats::mad()</code> for details.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

### Details

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowMads / matrixStats::colMads`.

### Value

Returns a [numeric vector](#) of length N (K).

- See also the base R version `base::rowMeans()`.

**Examples**

```

# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_Rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

colMeans2(dm_matrix)

# NOTE: Temporarily use verbose output to demonstrate which method is
#       which method is being used
options(DelayedMatrixStats.verbose = TRUE)
# By default, this uses a seed-aware method for a DelayedMatrix with a
# 'SolidRleArraySeed' seed
rowMeans2(dm_Rle)
# Alternatively, can use the block-processing strategy
rowMeans2(dm_Rle, force_block_processing = TRUE)
options(DelayedMatrixStats.verbose = FALSE)

```

---

colMedians,DelayedMatrix-method

*Calculates the median for each row (column) of a matrix-like object*

---

**Description**

Calculates the median for each row (column) of a matrix-like object.

**Usage**

```

## S4 method for signature 'DelayedMatrix'
colMedians(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

```

```

## S4 method for signature 'DelayedMatrix'
rowMedians(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,

```

```

    ...,
    useNames = TRUE
  )

```

### Arguments

**x** A NxK [DelayedMatrix](#).

**rows, cols** A [vector](#) indicating the subset of rows (and/or columns) to operate over. If [NULL](#), no subsetting is done.

**na.rm** If [TRUE](#), missing values ([NA](#) or [NaN](#)) are omitted from the calculations.

**force\_block\_processing** FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to [TRUE](#) (typically not advised). The block-processing strategy loads one or more (depending on `\link[DelayedArray]{getAutoBlockSize}()`) columns (`colFoo()`) or rows (`rowFoo()`) into memory as an ordinary `base::array`.

**...** Additional arguments passed to specific methods.

**useNames** If [TRUE](#) (default), names attributes of result are set. Else if [FALSE](#), no naming support is done.

### Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowMedians` / `matrixStats::colMedians`.

### Value

Returns a [numeric vector](#) of length N (K).

### Author(s)

Peter Hickey

### See Also

- `matrixStats::rowMedians()` and `matrixStats::colMedians()` which are used when the input is a `matrix` or `numeric` vector.
- For mean estimates, see `rowMeans2()` and `rowMeans()`.

### Examples

```

# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

---

 colOrderStats,DelayedMatrix-method

*Calculates an order statistic for each row (column) of a matrix-like object*

---

## Description

Calculates an order statistic for each row (column) of a matrix-like object.

## Usage

```
## S4 method for signature 'DelayedMatrix'
colOrderStats(
  x,
  rows = NULL,
  cols = NULL,
  which,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

```
## S4 method for signature 'DelayedMatrix'
rowOrderStats(
  x,
  rows = NULL,
  cols = NULL,
  which,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

## Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
which	An integer index in [1,K] ([1,N]) indicating which order statistic to be returned
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

**Details**

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowOrderStats` / `matrixStats::colOrderStats`.

**Value**

Returns a `numeric vector` of length `N (K)`.

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowOrderStats()` and `matrixStats::colOrderStats()` which are used when the input is a `matrix` or `numeric vector`.

**Examples**

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

# Only using columns 2-3
colOrderStats(dm_Matrix, cols = 2:3, which = 1)

# Different algorithms, specified by `which`, may give different results
rowOrderStats(dm_Matrix, which = 1)
rowOrderStats(dm_Matrix, which = 2)
```

---

colProds,DelayedMatrix-method

*Calculates the product for each row (column) of a matrix-like object*

---

**Description**

Calculates the product for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colProds(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  method = c("direct", "expSumLog"),
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

```
## S4 method for signature 'SolidRleArraySeed'
colProds(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  method = c("direct", "expSumLog"),
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowProds(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  method = c("direct", "expSumLog"),
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

### Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
method	A character vector of length one that specifies the how the product is calculated. Note, that this is not a generic argument and not all implementation have to provide it.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

### Details

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowProds / matrixStats::colProds`.

### Value

Returns a [numeric vector](#) of length N (K).

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowProds()` and `matrixStats::colProds()` which are used when the input is a matrix or numeric vector.
- For sums across rows (columns), see `rowSums2()` (`colSums2()`)
- `base::prod()`.

**Examples**

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'HDF5ArraySeed' seed
# NOTE: Requires that the HDF5Array package is installed
library(HDF5Array)
dm_HDF5 <- writeHDF5Array(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

colProds(dm_matrix)

rowProds(dm_matrix)
```

---

colQuantiles,DelayedMatrix-method

*Calculates quantiles for each row (column) of a matrix-like object*

---

**Description**

Calculates quantiles for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colQuantiles(
  x,
  rows = NULL,
  cols = NULL,
  probs = seq(from = 0, to = 1, by = 0.25),
  na.rm = FALSE,
  type = 7L,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE,
  drop = TRUE
```

```

)

## S4 method for signature 'DelayedMatrix'
rowQuantiles(
  x,
  rows = NULL,
  cols = NULL,
  probs = seq(from = 0, to = 1, by = 0.25),
  na.rm = FALSE,
  type = 7L,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE,
  drop = TRUE
)

```

### Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
probs	A numeric vector of J probabilities in [0, 1].
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
type	An integer specifying the type of estimator. See <code>stats::quantile()</code> for more details.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.
drop	If <a href="#">TRUE</a> a vector is returned if $J == 1$ .

### Details

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowQuantiles` / `matrixStats::colQuantiles`.

### Value

a [numeric](#) NxJ (KxJ) [matrix](#), where N (K) is the number of rows (columns) for which the J values are calculated.

### Author(s)

Peter Hickey

**See Also**

- `matrixStats::rowQuantiles()` and `matrixStats::colQuantiles()` which are used when the input is a matrix or numeric vector.
- `stats::quantile`

**Examples**

```
# A DelayedMatrix with a 'data.frame' seed
dm_df <- DelayedArray(data.frame(C1 = rep(1L, 5),
                                C2 = as.integer((0:4) ^ 2),
                                C3 = seq(-5L, -1L, 1L)))

# colnames, if present, are preserved as rownames on output
colQuantiles(dm_df)

# Input has no rownames so output has no rownames
rowQuantiles(dm_df)
```

---

colRanks,DelayedMatrix-method

*Calculates the rank of the elements for each row (column) of a matrix-like object*

---

**Description**

Calculates the rank of the elements for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colRanks(
  x,
  rows = NULL,
  cols = NULL,
  ties.method = c("max", "average", "first", "last", "random", "max", "min", "dense"),
  preserveShape = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowRanks(
  x,
  rows = NULL,
  cols = NULL,
  ties.method = c("max", "average", "first", "last", "random", "max", "min", "dense"),
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

**Arguments**

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
ties.method	A character string specifying how ties are treated. Note that the default specifies fewer options than the original matrixStats package.
preserveShape	If TRUE the output matrix has the same shape as the input x. Note, that this is not a generic argument and not all implementation of this function have to provide it.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

**Details**

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowRanks / matrixStats::colRanks`.

The `matrixStats::rowRanks()` function can handle a lot of different values for the `ties.method` argument. Users of the generic function should however only rely on `max` and `average` because the other ones are not guaranteed to be implemented:

`max` for values with identical values the maximum rank is returned

`average` for values with identical values the average of the ranks they cover is returned. Note, that in this case the return value is of type `numeric`.

**Value**

A [matrix](#) of type [integer](#) is returned, unless `ties.method = "average"` when it is of type [numeric](#).

The `rowRanks()` function always returns an NxK [matrix](#), where N (K) is the number of rows (columns) whose ranks are calculated.

The `colRanks()` function returns an NxK [matrix](#), if `preserveShape = TRUE`, otherwise a KxN [matrix](#).

Any [names](#) of x are ignored and absent in the result.

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowRanks()` and `matrixStats::colRanks()` which are used when the input is a [matrix](#) or [numeric](#) vector.
- [base::rank](#)

**Examples**

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colRanks(dm_Matrix)

rowRanks(dm_Matrix)
```

---

colSums2,DelayedMatrix-method

*Calculates the sum for each row (column) of a matrix-like object*

---

**Description**

Calculates the sum for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colSums2(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'Matrix'
colSums2(x, rows = NULL, cols = NULL, na.rm = FALSE, ..., useNames = TRUE)

## S4 method for signature 'SolidRleArraySeed'
colSums2(x, rows = NULL, cols = NULL, na.rm = FALSE, ..., useNames = TRUE)

## S4 method for signature 'DelayedMatrix'
rowSums2(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'Matrix'
rowSums2(x, rows = NULL, cols = NULL, na.rm = FALSE, ..., useNames = TRUE)
```

**Arguments**

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

**Details**

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowSums2 / matrixStats::colSums2`.

**Value**

Returns a [numeric vector](#) of length N (K).

**Author(s)**

Peter Hickey

**See Also**

- `matrixStats::rowSums2()` and `matrixStats::colSums2()` which are used when the input is a [matrix](#) or [numeric vector](#).
- For mean estimates, see `rowMeans2()` and `rowMeans()`.
- `base::sum()`.

**Examples**

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                           as.integer((0:4) ^ 2),
                                           seq(-5L, -1L, 1L)),
                                           ncol = 3))

colSums2(dm_matrix)

# NOTE: Temporarily use verbose output to demonstrate which method is
#       which method is being used
```

```

options(DelayedMatrixStats.verbose = TRUE)
# By default, this uses a seed-aware method for a DelayedMatrix with a
# 'SolidRleArraySeed' seed
rowSums2(dm_Matrix)
# Alternatively, can use the block-processing strategy
rowSums2(dm_Matrix, force_block_processing = TRUE)
options(DelayedMatrixStats.verbose = FALSE)

```

---

colTabulates,DelayedMatrix-method

*Tabulates the values in a matrix-like object by row (column)*

---

### Description

Tabulates the values in a matrix-like object by row (column).

### Usage

```

## S4 method for signature 'DelayedMatrix'
colTabulates(
  x,
  rows = NULL,
  cols = NULL,
  values = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowTabulates(
  x,
  rows = NULL,
  cols = NULL,
  values = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

```

### Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
values	the values to search for.
force_block_processing	FALSE (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .

... Additional arguments passed to specific methods.

useNames If `TRUE` (default), names attributes of result are set. Else if `FALSE`, no naming support is done.

### Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowTabulates` / `matrixStats::colTabulates`.

### Value

a `numeric`  $N \times J$  ( $K \times J$ ) `matrix`, where  $N$  ( $K$ ) is the number of rows (columns) for which the  $J$  values are calculated.

### Author(s)

Peter Hickey

### See Also

- `matrixStats::rowTabulates()` and `matrixStats::colTabulates()` which are used when the input is a `matrix` or `numeric` vector.
- `base::table()`

### Examples

```
# A DelayedMatrix with a 'DataFrame' seed
dm_DF <- DelayedArray(S4Vectors::DataFrame(C1 = rep(1L, 5),
                                           C2 = as.integer((0:4) ^ 2),
                                           C3 = seq(-5L, -1L, 1L)))

colTabulates(dm_DF)

rowTabulates(dm_DF)
```

---

colVars,DelayedMatrix-method

*Calculates the variance for each row (column) of a matrix-like object*

---

### Description

Calculates the variance for each row (column) of a matrix-like object.

### Usage

```
## S4 method for signature 'DelayedMatrix'
colVars(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
```

```

    force_block_processing = FALSE,
    ...,
    useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowVars(
  x,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  center = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

```

### Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
center	(optional) the center, defaults to the row means.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

### Details

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowVars / matrixStats::colVars`.

### Value

Returns a [numeric vector](#) of length N (K).

---

colWeightedMads,DelayedMatrix-method

*Calculates the weighted median absolute deviation for each row (column) of a matrix-like object*

---

### Description

Calculates the weighted median absolute deviation for each row (column) of a matrix-like object.

### Usage

```
## S4 method for signature 'DelayedMatrix'
colWeightedMads(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  constant = 1.4826,
  center = NULL,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowWeightedMads(
  x,
  w = NULL,
  rows = NULL,
```

```

cols = NULL,
na.rm = FALSE,
constant = 1.4826,
center = NULL,
force_block_processing = FALSE,
...,
useNames = TRUE
)

```

### Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
w	A <a href="#">numeric</a> vector of length K (N) that specifies by how much each element is weighted.
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
constant	A scale factor. See <code>stats::mad()</code> for details.
center	(optional) the center, defaults to the row means
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

### Details

The S4 methods for x of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowWeightedMads` / `matrixStats::colWeightedMads`.

### Value

Returns a [numeric vector](#) of length N (K).

### Author(s)

Peter Hickey

### See Also

- See also [rowMads](#) for the corresponding unweighted function.

**Examples**

```
# A DelayedMatrix with a 'matrix' seed
dm_matrix <- DelayedArray(matrix(c(rep(1L, 5),
                                as.integer((0:4) ^ 2),
                                seq(-5L, -1L, 1L)),
                                ncol = 3))

colWeightedMads(dm_matrix, w = 1:5)

rowWeightedMads(dm_matrix, w = 3:1)
```

---

```
colWeightedMeans,DelayedMatrix-method
```

*Calculates the weighted mean for each row (column) of a matrix-like object*

---

**Description**

Calculates the weighted mean for each row (column) of a matrix-like object.

**Usage**

```
## S4 method for signature 'DelayedMatrix'
colWeightedMeans(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

```
## S4 method for signature 'DelayedMatrix'
rowWeightedMeans(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

**Arguments**

**x** A NxK [DelayedMatrix](#).

**w** A [numeric](#) vector of length K (N) that specifies by how much each element is weighted.

rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .
...	Additional arguments passed to specific methods.
useNames	If <a href="#">TRUE</a> (default), names attributes of result are set. Else if <a href="#">FALSE</a> , no naming support is done.

### Details

The S4 methods for `x` of type [matrix](#), [array](#), [table](#), or [numeric](#) call `matrixStats::rowWeightedMeans / matrixStats::colWeightedMeans`.

### Value

Returns a [numeric vector](#) of length `N (K)`.

### Author(s)

Peter Hickey

### See Also

- `matrixStats::rowWeightedMeans()` and `matrixStats::colWeightedMeans()` which are used when the input is a [matrix](#) or [numeric vector](#).
- See also [rowMeans2](#) for the corresponding unweighted function.

### Examples

```
# A DelayedMatrix with a 'Matrix' seed
dm_Matrix <- DelayedArray(Matrix::Matrix(c(rep(1L, 5),
                                         as.integer((0:4) ^ 2),
                                         seq(-5L, -1L, 1L)),
                                         ncol = 3))

colWeightedMeans(dm_Matrix)
# Specifying weights inversely proportional to rowwise variances
colWeightedMeans(dm_Matrix, w = 1 / rowVars(dm_Matrix))
rowWeightedMeans(dm_Matrix, w = 1:3)
```

---

 colWeightedMedians,DelayedMatrix-method

*Calculates the weighted median for each row (column) of a matrix-like object*

---

## Description

Calculates the weighted median for each row (column) of a matrix-like object.

## Usage

```
## S4 method for signature 'DelayedMatrix'
colWeightedMedians(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

```
## S4 method for signature 'DelayedMatrix'
rowWeightedMedians(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)
```

## Arguments

x	A NxK <a href="#">DelayedMatrix</a> .
w	A <a href="#">numeric</a> vector of length K (N) that specifies by how much each element is weighted.
rows, cols	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
na.rm	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
force_block_processing	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by setting this to <a href="#">TRUE</a> (typically not advised). The block-processing strategy loads one or more (depending on <code>\link[DelayedArray]{getAutoBlockSize}()</code> ) columns ( <code>colFoo()</code> ) or rows ( <code>rowFoo()</code> ) into memory as an ordinary <a href="#">base::array</a> .

... Additional arguments passed to specific methods.

useNames If **TRUE** (default), names attributes of result are set. Else if **FALSE**, no naming support is done.

### Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowWeightedMedians` / `matrixStats::colWeightedMedians`.

### Value

Returns a `numeric vector` of length `N` (`K`).

### Author(s)

Peter Hickey

### See Also

- `matrixStats::rowWeightedMedians()` and `matrixStats::colWeightedMedians()` which are used when the input is a matrix or numeric vector.
- See also `rowMedians` for the corresponding unweighted function.

### Examples

```
# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_Rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

# Specifying weights inversely proportional to rowwise MADs
colWeightedMedians(dm_Rle, w = 1 / rowMads(dm_Rle))
```

---

colWeightedSds,DelayedMatrix-method

*Calculates the weighted standard deviation for each row (column) of a matrix-like object*

---

### Description

Calculates the weighted standard deviation for each row (column) of a matrix-like object.

### Usage

```
## S4 method for signature 'DelayedMatrix'
colWeightedSds(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
```

```

    force_block_processing = FALSE,
    ...,
    useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
colWeightedVars(
  x,

  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowWeightedSds(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

## S4 method for signature 'DelayedMatrix'
rowWeightedVars(
  x,
  w = NULL,
  rows = NULL,
  cols = NULL,
  na.rm = FALSE,
  force_block_processing = FALSE,
  ...,
  useNames = TRUE
)

```

### Arguments

<code>x</code>	A $N \times K$ <a href="#">DelayedMatrix</a> .
<code>w</code>	A <a href="#">numeric</a> vector of length $K$ ( $N$ ) that specifies by how much each element is weighted.
<code>rows, cols</code>	A <a href="#">vector</a> indicating the subset of rows (and/or columns) to operate over. If <a href="#">NULL</a> , no subsetting is done.
<code>na.rm</code>	If <a href="#">TRUE</a> , missing values ( <a href="#">NA</a> or <a href="#">NaN</a> ) are omitted from the calculations.
<code>force_block_processing</code>	<a href="#">FALSE</a> (the default) means that a seed-aware, optimised method is used (if available). This can be overridden to use the general block-processing strategy by

setting this to TRUE (typically not advised). The block-processing strategy loads one or more (depending on `\link[DelayedArray]{getAutoBlockSize}()`) columns (`colFoo()`) or rows (`rowFoo()`) into memory as an ordinary `base::array`.

... Additional arguments passed to specific methods.

useNames If `TRUE` (default), names attributes of result are set. Else if `FALSE`, no naming support is done.

## Details

The S4 methods for `x` of type `matrix`, `array`, `table`, or `numeric` call `matrixStats::rowWeightedSds` / `matrixStats::colWeightedSds`.

## Value

Returns a `numeric vector` of length `N (K)`.

## Author(s)

Peter Hickey

## See Also

## Examples

```
# A DelayedMatrix with a 'SolidRleArraySeed' seed
dm_Rle <- RleArray(Rle(c(rep(1L, 5),
                        as.integer((0:4) ^ 2),
                        seq(-5L, -1L, 1L))),
                  dim = c(5, 3))

colWeightedSds(dm_Rle, w = 1 / rowMeans2(dm_Rle))

# Specifying weights inversely proportional to rowwise means
colWeightedVars(dm_Rle, w = 1 / rowMeans2(dm_Rle))

# Specifying weights inversely proportional to columnwise means
rowWeightedSds(dm_Rle, w = 1 / colMeans2(dm_Rle))

# Specifying weights inversely proportional to columnwise means
rowWeightedVars(dm_Rle, w = 1 / colMeans2(dm_Rle))
```

---

DelayedMatrixStats     *DelayedMatrixStats: Functions that apply to rows and columns of DelayedMatrix objects.*

---

## Description

**DelayedMatrixStats** is a port of the **matrixStats** API to work with *DelayedMatrix* objects from the **DelayedArray** package. High-performing functions operating on rows and columns of *DelayedMatrix* objects, e.g. `colMedians()` / `rowMedians()`, `colRanks()` / `rowRanks()`, and `colSds()` / `rowSds()`. Functions optimized per data type and for subsetted calculations such that both memory usage and processing time is minimized.

`from_DelayedArray_to_simple_seed_class`  
*Coerce DelayedArray to its 'simple seed' form*

---

## Description

Coerce *DelayedArray* to its 'simple seed' form

## Usage

```
from_DelayedArray_to_simple_seed_class(x, drop = FALSE, do_transpose = TRUE)
```

## Arguments

<code>x</code>	A <a href="#">DelayedArray</a>
<code>drop</code>	If TRUE the result is coerced to the lowest possible dimension
<code>do_transpose</code>	Should transposed input be physically transposed?

## Details

Like `DelayedArray:::from_DelayedArray_to_array` but returning an object of the same class as `seedClass(x)` instead of an *array*. In doing so, all delayed operations are realised (including subsetting).

**Value**

An object of the same class as `seedClass(x)`.

**Note**

Can be more efficient to leave the transpose implicit (`do_transpose = FALSE`) and switch from a `row*()` method to a `col*()` method (or vice versa).

Only works on [DelayedArray](#) objects with 'simple seeds'

---

reexports	<i>Objects exported from other packages</i>
-----------	---------------------------------------------

---

**Description**

These objects are imported from other packages. Follow the links below to see their documentation.

**DelayedArray** [colMaxs](#), [colMins](#), [colRanges](#), [rowMaxs](#), [rowMins](#), [rowRanges](#)

---

subset_by_Nindex	subset_by_Nindex
------------------	------------------

---

**Description**

`subset_by_Nindex()` is an internal generic function not aimed to be used directly by the user. It is basically an S4 generic for `DelayedArray:::subset_by_Nindex`.

**Usage**

```
subset_by_Nindex(x, Nindex)
```

**Arguments**

<code>x</code>	An array-like object.
<code>Nindex</code>	An unnamed list of subscripts as positive integer vectors, one vector per dimension in <code>x</code> . Empty and missing subscripts (represented by <code>integer(0)</code> and <code>NULL</code> list elements, respectively) are allowed. The subscripts can contain duplicated indices. They cannot contain NAs or non-positive values.

**Details**

`subset_by_Nindex(x, Nindex)` conceptually performs the operation `x[Nindex[1], ..., Nindex[length(Nindex)]]`. `subset_by_Nindex()` methods need to support empty and missing subscripts, e.g., `subset_by_Nindex(x, list(NULL, integer(0)))` must return an `M x 0` object of class `class(x)` and `subset_by_Nindex(x, list(integer(0), integer(0)))` a `0 x 0` object of class `class(x)`.

Also, subscripts are allowed to contain duplicate indices so things like `subset_by_Nindex(x, list(c(1:3, 3:1), 2L))` need to be supported.

**Value**

A object of class `class(x)` of the appropriate type (e.g., integer, double, etc.). For example, if `x` is a [data.frame](#) representing an `M x N` matrix of integers, `subset_by_Nindex(x, list(NULL, 2L))` must return its 2nd column as a [data.frame](#) with `M` rows and 1 column of type integer.
